Course learning outcomes

- L.O.1 Determine the complexity of simple algorithms (polynomial time - nested loop - no recursive)
 - L.O.1.1 Give definition of Big-O notation
 - L.O.1.2 Determine complexity of simple polynomial algorithms

- L.O.2 Manipulate basic data structures such as list, tree and graph
 - L.O.2.1 Describe and present basic data structures such as: array, linked list, stack, queue, tree, and graph
 - L.O.2.2 Implement basic methods for each of basic data structures: array, linked list, stack, queue, tree, and graph

- L.O.3 Implement basic sorting and searching algorithms
 - L.O.3.1 Illustrate how searching algorithms work on data structures: array, linked list, stack, queue, tree, and graph
 - L.O.3.2 Illustrate how sorting algorithms work on an array
 - L.O.3.3 Implement necessary methods and proposed algorithms on a given data structure for problem solving

Definition

AVL Tree is:

- A Binary Search Tree,
- in which the heights of the left and right subtrees of the root differ by at most 1, and
- the left and right subtrees are again AVL trees.

Discovered by G.M. [Adel'son-Vel'skii](#) and E.M. [Landis](#) in 1962.

[AVL Tree](#) is a Binary Search Tree that is balanced tree.

Operations

Multiway Trees

B-Trees

A binary tree is an **AVL Tree** if

- **Each node satisfies BST property:** key of the node is greater than the key of each node in its left subtree and is smaller than or equals to the key of each node in its right subtree.
- **Each node satisfies balanced tree property:** the difference between the heights of the left subtree and right subtree of the node does not exceed one.

Balance factor

- left_higher (LH): $H_L = H_R + 1$
- equal_height (EH): $H_L = H_R$
- right_higher (RH): $H_R = H_L + 1$

(H_L, H_R : the heights of left and right subtrees)

AVL Balance

- When we insert a node into a tree or delete a node from a tree, the resulting tree may be unbalanced.
→ **rebalance the tree.**
- Four unbalanced tree cases:
 - **left of left**: a subtree of a tree that is left high has also become left high;
 - **right of right**: a subtree of a tree that is right high has also become right high;

AVL Right Balance Algorithm

- 1 **Algorithm** rightBalance(ref root
 <pointer>, ref taller <boolean>)
- 2 This algorithm is entered when the right
 subtree is higher than the left subtree.
- 3 **Pre:** root is a pointer to the root of the
 [sub]tree
- 4 taller is true
- 5 **Post:** root has been updated (if
 necessary)
- 6 taller has been updated

AVL Right Balance Algorithm

```
1 rightTree = root->right
2 // Case 1: Right of right. Single rotation
  left.
3 if rightTree is RH then
4     root = rotateLeft(root)
5     root->balance = EH
6     rightTree->balance = EH
7     taller = false
```

AVL Right Balance Algorithm

```
1  // Case 2: Left of Right. Double rotation required.
2  else
3      leftTree = rightTree->left
4      if leftTree->balance = RH then
5          |   root->balance = LH
6          |   rightTree->balance = EH
7      else if leftTree->balance = EH then
8          |   rightTree->balance = EH
9      else
10         |   root->balance = EH
11         |   rightTree->balance = RH
12     end
13     leftTree->balance = EH
14     root->right = rotateRight(rightTree)
15     root = rotateLeft(root)
16     taller = false
17 end
18 return root
```

AVL Delete Algorithm

The AVL delete follows the basic logic of the binary search tree delete with the addition of the logic to balance the tree. As with the insert logic, the balancing occurs as we back out of the tree.

- 1 **Algorithm** AVLDelete(ref root <pointer>, val deleteKey <key>, ref shorter <boolean>, ref success <boolean>)
- 2 This algorithm deletes a node from an AVL tree and rebalances if necessary.
- 3 **Pre:** root is a pointer to the root of the [sub]tree
- 4 deleteKey is the key of node to be deleted
- 5 **Post:** node deleted if found, tree unchanged if not found
- 6 shorter is true if subtree is shorter
- 7 success is true if deleted, false if not found
- 8 **Return** pointer to root of (potential) new subtree

Multiway Trees

B-Trees

A B-tree is an m -way tree with the following additional properties ($m \geq 3$):

- The root is either a leaf or has at least 2 subtrees.
- All other nodes have at least $\lceil m/2 \rceil - 1$ entries.
- All leaf nodes are at the same level.
